Art Unit: 2635

DETAILED ACTION

This action is responsive to communication filed on August 13, 2003.

Response to Amendment

The examiner has acknowledged the amendment of claims 1, 20, 22, and the cancellation of claims 2-5 and claims 10-19.

Response to Arguments

Applicant's arguments with respect to claims 1, 6-9, and 20-28 have been considered but are most in view of the new ground(s) of rejection.

Claim Objections

Claim 20 is objected to because of the following informalities: Claim 20 is dependent upon a cancelled claim. Appropriate correction is required.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2635

Claims 1, 6-9, 20-28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Want et al U.S Patent 6008727 in view of Armstrong U.S Patent 5461385 in view of Werb U.S Patent 6843427 and further in view of Santin et al. U.S Patent 5313848.

Regarding claim 1, Want et al teaches an interactive radio frequency tag comprising a passive radio frequency transponder (col. 2 line 30), including an antenna (col. 2 line 34), an interface for receiving external stimulus and integrated circuit (col. 3 lines 10-15) responsive to external stimulus. Want et al. is however silent on teaching one or more integrated circuit responsive to an external stimulus to irreversibly change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response in response to an external stimulus that includes detecting a motion. Armstrong in an art related RF/ID Transponder System Employing Multiple Transponders And A Sensor invention teaches a transponder having one or more integrated circuit responsive to an external stimulus to change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response (col. 2 lines 45-54) but is also silent on teaching providing a response in response to detecting a motion and the state of the transponder is irreversibly changed. Werb in an art related invention in the same field of endeavor of radio frequency tag teaches a radio frequency tag having motion detector and changing the response state in term of the frequency of transmission based on the detection of motion (col. 15 lines 54-56) and is also silent on teaching the state of the transponder is irreversibly changed. Santin et al. in an art related electronic monitor device teaches irreversibly

Art Unit: 2635

change the state of a transponder (col. 5 lines 13-20) and the state is changed by an external stimulus from a draw string (col. 5 lines 44-50).

It would have been obvious to one of ordinary skill in the art to have one or more integrated circuit responsive to an external stimulus to irreversibly change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response which includes detecting a motion in Want et al. as evidenced by Armstrong in view of Werb in view of Santin et al. because Want et al. suggests a transponder with integrated circuit and responsive to external stimulus and Armstrong teaches a transponder having one or more integrated circuit responsive to an external stimulus to change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response in order to provide different information based on the external stimulus and Werb teaches a radio frequency tag having motion detector and changing the response state in term of the frequency of transmission based on the detection of motion. The use of an external stimulus to irreversibly change the state of a transponder is further evidenced by Santin et al.

Regarding claims 6 and 7, Want et al teaches an interactive radio frequency tag apparatus comprising of an output device in the form of a light emitting diode which generates a visible signal in (col. 17 lines 8).

Regarding claim 8, Want et al. teaches a radio frequency tag apparatus giving audio or visual indication (col. 12 line 2-3).

Art Unit: 2635

Regarding claim 9, Want et al teaches that the output device generates a tactile signal (col. 2 line 54).

Regarding claim 20, Want et al. teaches the use of various environmental sensors including temperature sensors (col. 3 lines 10-17).

Regarding claim 21, Want et al teaches a radio frequency tag apparatus with an output device of a light emitting diode or an audio alert signal output (col. 12 lines 3-4). Speakers are typically used to output an audio alert signal.

Regarding claim 22, Want et al teaches an interactive radio frequency tag comprising a passive radio frequency transponder (col. 2 line 30), including an antenna (col. 2 line 34), an interface for receiving external stimulus and integrated circuit (col. 3 lines 10-15) responsive to external stimulus. Want et al. is however silent on teaching one or more integrated circuit responsive to an external stimulus to irreversibly change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response that includes detecting a motion. Armstrong in an art related RF/ID Transponder System Employing Multiple Transponders And A Sensor invention teaches a transponder having one or more integrated circuit responsive to an external stimulus to change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response (col. 2 lines 45-54). Armstrong further teaches an external stimulus (pressure) to the pressure sensor interface for changing the state of the transponder (col. 2 lines 60-65) but is also silent on teaching providing a response in response to detecting a motion and irreversibly change the state of the transponder from a first

Art Unit: 2635

state to a second state. Werb in an art related invention in the same field of endeavor of radio frequency tag teaches a radio frequency tag having motion detector and changing the response state in term of the frequency of transmission based on the detection of motion (col. 15 lines 54-56) but is also silent on teaching irreversibly changing the state of the transponder from a first state to a second state. Santin et al. in an art related electronic monitor device teaches irreversibly change the state of a transponder (col. 5 lines 13-20) and the state is changed by an external stimulus from a draw string (col. 5 lines 44-50).

It would have been obvious to one of ordinary skill in the art to have one or more integrated circuit responsive to an external stimulus to change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response which includes detecting a motion in Want et al. as evidenced by Armstrong in view of Werb because Want et al. suggests a transponder with integrated circuit and responsive to external stimulus and Armstrong teaches a transponder having one or more integrated circuit responsive to an external stimulus to change the state of the transponder between a first active state in which the transponder provides a first active response and a second active state in which the transponder provides a second active response in order to provide different information based on the external stimulus and Werb teaches a radio frequency tag having motion detector and changing the response state in term of the frequency of transmission based on the detection of motion. The use of an external stimulus to irreversibly change the state of a transponder is further evidenced by Santin et al.

Art Unit: 2635

Regarding claim 23 and 24, Want et al is silent on teaching generating a signal to indicate that the state of the radio frequency tag has change. Want et al however teaches using a flashing LED to indicate the reading state of a radio frequency tag (col. 12 line 3). One skill in the art recognizes that a flashing LED provides a visible signal as to the state of the RF tag.

Regarding claim 25, Want et al teaches an audible alert to provide indication of the state of the RF tag.

Regarding claim 26, Want et al teaches a tactile output based on internal state of the RF tag (col. 8. lines 40-41).

Regarding claim 27, Want et al teaches an interface that includes a button (col. 5 line 23).

Regarding claim 28, Want et al teaches a RF tag with an optionally attached sensor (560).

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Art Unit: 2635

however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Vernal U Brown whose telephone number is 703-305-3864. The examiner can normally be reached on M-Th, 8:30 AM-6:30 PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Michael Horabik can be reached on 703-305-4704. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9314.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-4750.
